Acme Engineering Handbook

Acme Corporation builds and operates software for its customers. This handbook describes how the engineering team works day to day. It is owned by the engineering group and reviewed every quarter.

Code review. Every change must be reviewed by at least one other engineer before it is merged. Reviewers check correctness, readability, and test coverage. A change that touches billing or authentication needs two reviewers.

Deployments. The team deploys to production several times per day. Each deployment is automated and can be rolled back with a single command. Engineers deploy their own changes and watch the dashboards afterward.

Production incidents. When a service breaks in production, the on-call engineer opens an incident, posts updates in the incident channel, and works the problem until the service recovers. Every incident is followed by a written review that focuses on causes, not blame.

On-call. Engineers take turns being on call for one week at a time. The on-call engineer responds to alerts within fifteen minutes and hands off any open issues at the end of the rotation.
